PROGRAM 1

INSURANCE DATABASE

Consider the Insurance database given below. The data types are specified.

PERSON (driver_id: String, name: String, address: String)

CAR (reg_num: String, model: String, year: int)

ACCIDENT (report_num: int, accident_date: date, location: String)

OWNS (driver_id: String, reg_num: String)

PARTICIPATED (driver_id: String, reg_num: String, report_num: int, damage_amount: int)

- i) Create the above tables by properly specifying the primary keys and the foreign keys.
- ii) Enter at least five tuples for each relation.
- iii) Demonstrate how you
 - a. Update the damage amount to 25000 for the car with a specific reg-num (example 'K A053408') for which the accident report number was 12.
 - b. Add a new accident to the database.
- iv) Find the total number of people who owned cars that involved in accidents in 2008.
- v) Find the number of accidents in which cars belonging to a specific model (example) were involved.

CREATE DATABASE Insurance;

USE Insurance;

----- Create the above tables by properly specifying the primary keys and the foreign keys.

```
CREATE TABLE PERSON  
  
(  
  
DRIVER_ID VARCHAR(15),  
  
NAME VARCHAR(30) NOT NULL,  
  
ADDRESS VARCHAR(30),  
  
PRIMARY KEY(DRIVER_ID)  
  
);
```

```
CREATE TABLE CAR(  
  
REG_NUM VARCHAR(15),  
  
MODEL VARCHAR(15),  
  
YEAR INT,  
  
PRIMARY KEY (REG_NUM)  
  
);
```

```
CREATE TABLE ACCIDENT(  
  
REPORT_NUM INT,  
  
ACCIDENT_DATE DATE,  
  
LOCATION VARCHAR(30),  
  
PRIMARY KEY (REPORT_NUM)  
  
);
```

```
CREATE TABLE OWNS(  
  
DRIVER_ID VARCHAR(15),
```

```
REG_NUM VARCHAR(15),  
  
FOREIGN KEY (DRIVER_ID) REFERENCES PERSON(DRIVER_ID),  
  
FOREIGN KEY (REG_NUM) REFERENCES CAR(REG_NUM)  
  
);
```

```
CREATE TABLE PARTICIPATED(  
  
DRIVER_ID VARCHAR(15),  
  
REG_NUM VARCHAR(15),  
  
REPORT_NUM INT,  
  
DAMAGE_AMOUNT INT,  
  
FOREIGN KEY (DRIVER_ID) REFERENCES PERSON(DRIVER_ID),  
  
FOREIGN KEY (REG_NUM) REFERENCES CAR(REG_NUM),  
  
FOREIGN KEY (REPORT_NUM) REFERENCES ACCIDENT(REPORT_NUM)  
  
);
```

----- Enter at least five tuples for each relation.

```
INSERT INTO PERSON  
  
VALUES("A01","Richard","Srinivas Nagar"),("A02","Pradeep","Rajaji Nagar"),

PROGRAM 2

BANKING ENTERPRISE DATABASE

Consider the following database for a banking enterprise.

Branch (branch-name: String, branch-city: String, assets: real)

BankAccount(accno: int, branch-name: String, balance: real)

BankCustomer (customer-name: String, customer-street: String, customer-city: String)

Depositer(customer-name: String, accno: int)

Loan (loan-number: int, branch-name: String, amount: real)

- i. Create the above tables by properly specifying the primary keys and the foreign keys.
- ii. Enter at least five tuples for each relation.
- iii. Find all the customers who have at least two accounts at the *Main* branch (ex. SBI_ResidencyRoad).
- iv. Find all the customers who have an account at *all* the branches located in a specific city (Ex. Delhi).
- v. Demonstrate how you delete all account tuples at every branch located in a specific city (Ex. Bombay).

```
create database sample11;
```

```
use sample11;
```

```
CREATE TABLE branch
```

```
(  
    branch_name VARCHAR(20),  
    branch_city VARCHAR(20),  
    assets REAL,  
    PRIMARY KEY(branch_name)  
);
```

```
CREATE TABLE accounts
```

```
(  
    acc_no INT,  
    branch_name VARCHAR(50),  
    balance REAL,
```

```
PRIMARY KEY(acc_no),  
FOREIGN KEY(branch_name) REFERENCES branch(branch_name)  
ON UPDATE CASCADE ON DELETE CASCADE  
);
```

```
CREATE TABLE customer  
(  
    customer_name VARCHAR(20),  
    customer_street VARCHAR(50),  
    customer_city VARCHAR(20),  
    PRIMARY KEY(customer_name)  
);
```

```
CREATE TABLE depositor  
(  
    customer_name VARCHAR(20),  
    acc_no INT,  
    PRIMARY KEY(customer_name, acc_no),  
    FOREIGN KEY(customer_name) REFERENCES customer(customer_name)  
    ON UPDATE CASCADE ON DELETE CASCADE,  
    FOREIGN KEY(acc_no) REFERENCES accounts(acc_no)  
    ON UPDATE CASCADE ON DELETE CASCADE  
);
```

```
CREATE TABLE loan  
(  
    loan_number INT,
```

```

branch_name VARCHAR(50),

amount REAL,

PRIMARY KEY(loan_number),

FOREIGN KEY(branch_name) REFERENCES branch(branch_name)

ON UPDATE CASCADE ON DELETE CASCADE

);

```

```

INSERT INTO branch

```

```

VALUES ('SBI_Chamrajpet','Bangalore',50000),('SBI_ResidencyRoad','Bangalore',10000),

('SBI_ShivajiRoad','Bombay',20000),('SBI_ParlimentRoad','Delhi',10000),

('SBI_Jantarmanatar','Delhi',20000);

```

```

SELECT * FROM branch;

```

Result Grid			
Filter Rows: <input type="text"/>			
Edit:    			
	branch_name	branch_city	assets
▶	SBI_Chamrajpet	Bangalore	50000
	SBI_Jantarmanatar	Delhi	20000

PROGRAM 3

SUPPLIER DATABASE

Consider the following schema:

SUPPLIERS(sid: integer, sname: string, address: string)

PARTS(pid: integer, pname: string, color: string)

CATALOG(sid: integer, pid: integer, cost: real)

The Catalog relation lists the prices charged for parts by Suppliers.

Write the following queries in SQL:

- i. Find the pnames of parts for which there is some supplier.
- ii. Find the snames of suppliers who supply every part.
- iii. Find the snames of suppliers who supply every red part.
- iv. Find the pnames of parts supplied by Acme Widget Suppliers and by no one else.
- v. Find the sids of suppliers who charge more for some part than the average cost of that part (averaged over all the suppliers who supply that part).
- vi. For each part, find the sname of the supplier who charges the most for that part.

```
create database supplier;
```

```
use supplier;
```

```
create table suppliers(
```

```
sid int not null,
```

```
sname varchar(20) not null,
```

```
address varchar(20) not null,
```

```

PROGRAM 4

STUDENT FACULTY DATABASE

Consider the following database for student enrollment for course :

STUDENT(snum : integer, sname : string, major: string, lvl : string, age: integer)

CLASS(cname: string, meets at: time, room: string, fid: integer)

ENROLLED(snum: integer, cname: string)

FACULTY(fid: integer, fname: string, deptid: integer)

The meaning of these relations is straightforward; for example, Enrolled has one record per student-class pair such that the student is enrolled in the class. Level(lvl) is a two character code with 4 different values (example: Junior: JR etc)

Write the following queries in SQL. No duplicates should be printed in any of the answers.

- i. Find the names of all Juniors (level = JR) who are enrolled in a class taught by
- ii. Find the names of all classes that either meet in room R128 or have five or more Students enrolled.
- iii. Find the names of all students who are enrolled in two classes that meet at the same time.
- iv. Find the names of faculty members who teach in every room in which some class is taught.
- v. Find the names of faculty members for whom the combined enrollment of the courses that they teach is less than five.
- vi. Find the names of students who are not enrolled in any class.

- vii. For each age value that appears in Students, find the level value that appears most often. For example, if there are more FR level students aged 18 than SR, JR, or SO students aged 18, you should print the pair (18, FR).

```
create database studentfaculty;
```

```
use studentfaculty;
```

```
create table student(  
    snum int not null,  
    sname varchar(20) not null,  
    major varchar(2) not null,  
    lvl varchar(2) not null,  
    age int not null,  
    primary key (snum)  
);
```

```
create table faculty(  
    fid int not null,  
    fname varchar(20) not null,  
    deptid int not null,  
    primary key(fid)  
);
```

```
create table class(  
  
cname varchar(20) not null,  
  
meetsat datetime not null,  
  
room varchar(4) not null,  
  
fid int not null,  
  
primary key (cname),  
  
foreign key(fid)references faculty(fid)  
  
);
```

```
create table enrolled(  
  
snum int not null,  
  
cname varchar(20) not null,  
  
primary key(snum,cname),  
  
foreign key(snum)references student(snum),  
  
foreign key(cname) references class(cname )  
  
);
```

```
insert into student  
  
values (1,"Jhon","CS","Sr",19) ,(2,"Smith","CS","Jr",20),  
  
(3,"Jacob","CV","Sr",20),(4,"Tom","CS","Jr",20),

AIRLINE FLIGHT DATABASE

Consider the following database that keeps track of airline flight information:

FLIGHTS(flno: integer, from: string, to: string, distance: integer, departs: time, arrives: time, price: integer)

AIRCRAFT(aid: integer, aname: string, cruisingrange: integer)

CERTIFIED(eid: integer, aid: integer)

EMPLOYEES(eid: integer, ename: string, salary: integer)

Note that the Employees relation describes pilots and other kinds of employees as well; Every pilot is certified for some aircraft, and only pilots are certified to fly.

Write each of the following queries in SQL.

- i. Find the names of aircraft such that all pilots certified to operate them have salaries more than Rs.80,000.
- ii. For each pilot who is certified for more than three aircrafts, find the eid and the maximum cruisingrange of the aircraft for which she or he is certified.
- iii. Find the names of pilots whose salary is less than the price of the cheapest route from Bengaluru to Frankfurt.
- iv. For all aircraft with cruisingrange over 1000 Kms, find the name of the aircraft and the average salary of all pilots certified for this aircraft.
- v. Find the names of pilots certified for some Boeing aircraft.
- vi. Find the aids of all aircraft that can be used on routes from Bengaluru to New Delhi.
- vii. A customer wants to travel from Madison to New York with no more than two changes of flight. List the choice of departure times from Madison if the customer wants to arrive in New York by 6 p.m.
